Fig. 14A

A network diagram showing a central node PC2 connected to five peripheral nodes PC1, PC1', PC1'', PC1''', and PC1'''. Each node is labeled with 120 and 105. A reference numeral 101 points to the network structure.

Hand-drawn phylogenetic tree showing relationships between NS, PC, and I. NS is the outgroup, leading to a clade containing PC and I. PC is further divided into two sub-clades. Bootstrap values are indicated at the nodes.

Shown is direct connection of optic fiber 99 from Internet 3 (or other network) to memory microchip RAM' 66', the connection preferably at a central position 140 of microchip 66' to provide equal access to stored data on chip (the direct connection can be anywhere on microchip 66'). DSP 89, digital signal processor, is on chip 66' to connect to 99 optic fiber. RAM' 66' for shared memory use among personal computers PC 1 and for broadcast use. RAM' 66' can be volatile or non-volatile (Flash-type memory). Chip 66' can have more than one DSP 89, like Fig. 20 B.
